

Darfield Autumn 1

The trial was on a Darfield sheep and beef farm. It was started on 11 December 2007 and is ongoing. The trial area was dryland ryegrass-white/red clover based pasture with Italian ryegrass, chicory and plantain. The plots were measured at Day 21. The experiment was unreplicated.

Urea 80 performed better than LessN 40 which was better than control but statistical analysis was not possible for this unreplicated experiment.
